Build Your AI Agent Content System

A complete step-by-step guide to automating your entire content workflow using Claude Code — from scraping viral data to generating scripts in your voice.

By **Manthan Jethwani** · Phaze AI

What You Will Build

A 4-agent AI pipeline that runs inside Claude Code:

- Agent 01 — Content Scraper: pulls viral posts from Instagram, YouTube & Twitter
- Agent 02 — Validation Agent: scores every post and finds what is working right now
- Agent 03 — Script Writer: writes your reel script in your exact tone and voice
- Agent 04 — Hook Generator: creates 5 hook variations matched to your best reels

PHASE 1 Install VS Code

Your command centre — this is where all agents run

VS Code is the development environment where Claude Code lives. Every command, every agent, every skill runs from inside its terminal. This is the only tool you need on your desktop.

- 1 Go to code.visualstudio.com/download
- 2 Download the version for your operating system — Mac, Windows, or Linux
- 3 Install and open VS Code
- 4 Open the built-in terminal: go to View → Terminal, or press Ctrl+` on Windows / Cmd+` on Mac

Everything from Phase 2 onwards runs inside this terminal. Keep it open.

PHASE 2 Install & Activate Claude Code

The AI agent brain — connects to your file system and the internet

Claude Code is a terminal-based AI agent. Unlike regular Claude, it can read your files, write scripts, run commands, install tools, and chain actions together — all from a single prompt.

Requirement: Active Claude Pro or Team subscription at claude.ai (\$20/month)

- 1 Open the Extensions panel in VS Code — click the icon on the left sidebar or press Ctrl+Shift+X
- 2 Search for Claude Code and click Install
- 3 Open your terminal in VS Code and type `claude`, then press Enter
- 4 Sign in with your Anthropic account when prompted
- 5 Test that it is working by typing this prompt:

```
Tell me what files are in this folder
```

If Claude responds with a file list — you are live and ready to move to Phase 3.

PHASE 3 Install Apify Agent Skills

The scraping layer — gives Claude the ability to pull data from any platform

Apify is a web scraping platform. Their agent-skills package adds scraping capabilities directly into Claude Code — so it can pull posts, engagement data, and captions from Instagram, YouTube, Twitter, and more without you writing a single line of code.

- 1 In your VS Code terminal, run this command:

```
npx skills add https://github.com/apify/agent-skills
```

- 2 Wait for the installation to complete — it takes about 30 seconds

- 3 Verify the install worked by asking Claude:

```
What scraping skills do you have available?
```

Claude should list available platform scrapers. If you see Instagram, YouTube, and Twitter — the install was successful.

PHASE 4 Install Content Strategy Skill

Trains Claude to think like a viral content strategist

This skill from the marketingskills repository teaches Claude to map topics to viral angles, identify what is working in your niche, score content ideas by impact, and structure everything into searchable and shareable formats.

- 1 Run this command in your terminal:

```
npx skills add https://github.com/coreyhaines31/marketingskills --skill content-strategy
```

2 Also install the AI Labs writing skill:

```
npx skills add https://github.com/ailabs-393/ai-labs-claude-skills
```

3 Verify both are installed:

```
What content strategy and writing skills do you have available?
```

PHASE 5 Create Skill 1 — Content Scraper

Agent 01: pulls viral posts from Instagram, YouTube and Twitter

Now you tell Claude exactly what to scrape, from which platforms, and what data to collect. This becomes a saved, reusable skill you can run any time with a single prompt. Replace the keywords and competitor handles with your own before running.

1 Paste the following prompt into your Claude Code terminal:

```
Create a new skill called "content-scraper".

This skill should:
- Scrape Instagram Reels, YouTube Shorts, and Twitter/X posts For scarping use agent skills and it should also provide the transcript using whisper.
- Focus only on AI tools, Claude Code, and automation niche content
- Target these keywords: "Claude Code", "AI agents", "N8N automation", "AI coding", "vibe coding", "Claude skills", "OpenClaw", "AI automation"
- Track these competitor accounts: [paste 3-5 competitor handles here]
- For each post collect: hook text, full caption, views, likes, comments, engagement rate, post date, platform, content format
- Pull last 7 days of content only
- Save output as a table sorted by views, highest first
- Flag any post with ER above 5% or views above 100K with a VIRAL tag
```

2 Once the skill is created, run it:

```
Run content-scraper and show me the results
```

Results start populating in 60 to 90 seconds. You will see a live table of posts with views, likes, comments, and engagement rates.

PHASE 6 Create Skill 2 — Validation Agent

Agent 02: scores every post and finds what is working right now

The validation agent reads the scraper output and scores every post across views, engagement rate, and comment volume. It removes low-performing content, clusters the rest by topic, and tells you exactly what to make next — with data to back it up.

1 Paste the following prompt into Claude Code:

```
Create a new skill called "content-validator".
```

This skill reads the latest content-scraper output and does the following:

SCORING – Score every post on:

- Views: 40% weight. Flag anything above 100K as high-signal
- Engagement Rate (likes + comments divided by views): 35% weight.
Flag above 5% as viral
- Comment volume: 25% weight. High comments = high debate = high reach

FILTERING – Remove any post with:

- Under 10,000 views
- Under 2% engagement rate
- Posted more than 30 days ago

TOPIC CLUSTERING – Group remaining posts by topic.

Label each cluster clearly, for example:

"Claude Code tutorials", "AI automation income",
"Agent setup walkthroughs", "AI vs traditional tools"

RANKING OUTPUT – Always show me:

1. Top 5 topics ranked by average views this week
2. Top 3 content formats getting the most shares
3. One recommended topic for my next reel – with the reason why
4. Any topic appearing 3 or more times in top results – flag as repeat viral signal
5. Any format in the top 10 last week AND this week – flag as sustained trend

OUTPUT FORMAT:

- Clean table for topic rankings
- One-line recommendation at the top in bold
- Keep it specific – give numbers, not vague advice

2 Run the validator:

Run content-validator on the latest content-scraper output

PHASE 7 Chain Both Agents Together

Run the full pipeline — Agent 01 + Agent 02 in one command

Once both skills are working individually, you can run the entire scrape-to-validate pipeline in a single prompt. This takes about 2 minutes and gives you a ranked topic list with a specific recommendation for today's reel.

1 Run both agents end to end:

```
Run content-scraper, then immediately pass the results
to content-validator. Give me the final ranked topic list
and one recommended script topic for today's reel.
```

This is your daily research command. Run it every morning before filming and you will never wonder what to post again.

PHASE 8 Build the Writer & Hook Agent

Agent 03 + 04: writes your script and generates 5 hooks in your voice

This phase trains Claude on your voice using 20 to 30 of your past scripts. It then creates two final skills — a script writer that sounds exactly like you, and a hook generator that produces 5 tested hook variations for every reel.

Step 1 — Feed Claude Your Past Scripts

Collect 20 to 30 of your past reel scripts, captions, or voice notes. The more you give it, the more accurately it will copy your tone. Label each one clearly.

```
I am going to give you 20-30 of my past reel scripts.
Read all of them carefully. Do not write anything yet.
After reading, identify:

1. My vocabulary — words I use often, words I never use
2. My sentence length — short punchy lines or longer explanations?
3. My structure — how do I open, build, and close a reel?
4. My CTA style — how do I end my videos?
5. My Hinglish pattern — how do I mix Hindi and English?
6. My energy — casual, authoritative, excited, or calm?

Here are my scripts:

Script 1: [paste here]
Script 2: [paste here]
Script 3: [paste here]
... continue for all 20-30 scripts
```

Step 2 — Create the Voice Writer Skill

```
Based on everything you just read, create a new skill
called "my-voice-writer".
```

```
This skill must:
```

- Write all scripts in my exact tone – same Hinglish mix, same energy, same sentence structure
- Never sound formal or generic
- Always structure scripts as:
[BEAT 1] -> [BEAT 2] -> [BEAT 3] -> [CTA]
- Keep each beat to 2-3 sentences max – I talk fast
- CTA must always be a comment trigger
e.g. "X comment karo, main bhej dunga"
- Never include a hook – that is handled by the hook agent
- When in doubt, write shorter not longer

Step 3 — Create the Hook Generator Skill

```
Create a new skill called "hook-generator".
```

```
This skill takes a script topic and generates exactly 5 hooks.
```

```
Rules for every hook:
```

- Maximum 2 lines – must be speakable in under 4 seconds
- Must be in Hinglish – natural mix, not forced
- Never start with "Aaj main" or "Is video mein"
- Each hook uses a different proven pattern:

```
Hook 1: "Aisi honi chahiye X" – aspirational, shows the better version
```

```
Hook 2: Pain point – name a frustration the viewer feels right now
```

```
Hook 3: "Log nahi jaante" – exclusivity, insider knowledge feel
```

```
Hook 4: Time or money claim – specific number, specific result
```

```
Hook 5: Curiosity gap – ask something they cannot answer
        without watching
```

```
After generating all 5, add one line per hook explaining:
```

- Which pattern it uses
- Which of my past reels it matches (by views)
- Confidence score out of 10 based on niche data

Step 4 — Run the Full 4-Agent Pipeline

Once all four skills are set up, run the entire system in one prompt. Replace the topic with whatever today's content idea is.

```
Run content-scraper, then content-validator, then
my-voice-writer, then hook-generator.
```

Topic for today: [paste today's topic here]

Give me:

1. Validated topic confirmation with average views
2. Full script in my voice — no hook included
3. Five hooks with confidence scores
4. Recommended hook to use today with reason why

This is your complete system. Four agents running in sequence — from raw data to a camera-ready script and five hooks. Total time: under 3 minutes.

One More Thing

I am launching a full video walkthrough of this exact system in a few days — where I build all 4 agents live on camera, step by step.

Follow me so you do not miss it. And join the WhatsApp community where I share prompts, skills, and updates before anyone else.
